Subject:

seq search

This is in regard to case #10006265

Please search SEQ ID NOs, 2, 4, and 17(protein) against the commercial <u>nucleotide</u> databases in both a standard search and a standard oligomer search. The following information may be helpful in the search. I previously requested an alignment of these sequences. The results were as follows: SEQ ID NOs 2 and 17 are identical from 1-642. SEQ ID NO 2 and 17 are identical with SEQ ID NO 4 from 1-238. If this is in any way unclear, please call and I'll be happy to clarify.

The claims of interest are appended below. If you identify any other necessary searches based on these claims I would appreciate they be performed also. I'm fairly confident I have requested all that is necessary though. Incidentally, SEQ ID NOs 1, 3, and 16 encode SEQ ID NOs 2, 4, and 17, respectively.

1. An isolated nucleic acid of any one of (a) to (d) below:

(a) a nucleic acid encoding a protein comprising the amino acid sequence of any one of SEQ ID NOs:2, 4 or 17,

(b) a nucleic acid comprising a coding region in the nucleotide sequence of any

one of SEQ ID NOs:1, 3 or 16,

(c) a nucleic acid encoding a protein that comprises the amino acid sequence of any one of SEQ ID NOs:2, 4 or 17, in which one or more amino acids are replaced, deleted, inserted and/or added and that is functionally equivalent to the protein comprising the amino acid sequence of any one of SEQ ID NOs:2, 4 or 17, and

(d) a nucleic acid that hybridizes under stringent conditions with the nucleic acid comprising the nucleotide sequence of any one of SEQ ID NOs:1, 3 or 16, and that encodes a protein functionally equivalent to the protein comprising the amino acid sequence of any one of SEQ ID NOs:2, 4 or 17.

2. An isolated nucleic acid encoding the amino acid sequence of any one of SEQ ID NOs:2, 4 or 17 or a fragment thereof.

Thank you, Pat Riggins

NR10 occurs as a transmembrane protein and a soluble protein. NR10 is a haemopoietin receptor molecule which participates in immunoregulation and haematopoietic cell regulation in vivo, and is useful in searching for haematopoietic factors capable of binding to the receptor. NR10 can be used for the identification of substances for the treatment and prevention of immune and haematopoietic disorders including autoimmune diseases and allergies such as metal and college of the disorders including autoimmune diseases and allergies such as metal and

                                                                                                                                         The present sequence encodes a human haemopoietin receptor protein (NR10), specifically designated NR10.3. NR10 occurs as a transmembrane protein and a soluble protein. NR10 is a haemopoietin receptor molecule which participates in immunoregulation and haematopoietic cell regulation in vivo, and is useful in searching for haematopoietic factors capable of binding to the receptor. NR10 can be used for the identification of substances for the treatment and prevention of immune and haematopoietic discovers including autoimmune diseases and allergies such as metal and

                                                                                                                                                                                                                                                                                     zcytor17 has immunomodulatory, antiinflammatory, antiviral, cytostatic, antirheumatic, antiarthritic and muscular activities. The zcytor17 cantirheumatic, antiarthritic and muscular activities. The zcytor17 proteins are useful for treating and diagnosing lymphoid, immune, inflammatory, spleenic, blood or bone disorders. Agonists or anti-cytor17 antibodies are useful in stimulating cell-mediated immunity and for stimulating lymphocyte proliferation, such as in the treatment of infections involving immunosuppression, including certain viral infections. They are also useful for inducting cytocoxicity and for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating autoimmune diseases (e.g. zheumatoid arthritis and multiple sclerosis), inflammatory diseases (e.g. Crohn's disease), cancer, pancreatitis, and inflammatory bowel disease. Zcytor17 was mapped to chromosome 5, specifically to the 5q11 chromosomal region. ABA33767 to ABA33363 and ABB05730 to ABB05745 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated polynucleotide useful for treating and spleenic, blood or bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zcytor17; chromosome 5; 5q11; cytokine receptor; immunomodulatory; antiivital; antiirheumatic; antiirhitic; cytostatic; muscular; lymphoid; immune; inflammatory; spleenic; blood; bone; infection; immunosuppression; cytotoxicity; leukopenia; Crohn's disease; autoimmune disease; rheumatoid arthritis; multiple sclerosis; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated zcytor17 ligand polypeptide. A polypeptide of the invention has antiinflammatory, dermatological, immunosuppressive, and antimicrobial activity, and may have a use in a vaccine. The polypeptide is useful for treating inflammatory diseases, such as inflammatory bowel disease, ulcerative colitis, Crohn's disease, atopic dermatitis, eczema, psoriasis, endotoxaemia, septicaemia, toxic shock syndrome or infectious diseases. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New zcytor17 ligand polypeptides, useful for treating inflammatory diseases, such as inflammatory bowel disease, ulcerative colitis,

Novel multimeric or heterodimeric cytokine receptors useful for treating chronic inflammatory disease such as inflammatory bowel disease, ulcerative colitis, acute inflammatory disease such as endotoxemia,

Example 3; SEQ ID NO 4; 205pp; English

The invention describes an isolated multimeric or heterodimeric cytokine receptor (I) having at least one polypeptide having 90 percent sequence (C identity with a 732 (S1) or 649 (S2) amino acid sequence given in C specification, and where (I) binds a ligand comprising a 164 (S3) amino C acid sequence, given in specification, or at least one polypeptide (C comprising an antibody to (I) and a cytokine-binding domain of a class (C in cytokine receptor. A composition (C1) comprising (I) and a cytokine-binding domain of a class (C in cytokine reducing haematopoietic cells and hematopotetic progenitor cells in a mammal; inhibiting zcytor171ig-induced proliferation or differentiation (C inflammatory disease in which zcytor17lig plays a role. The disease is a crytorior17lig-induced inflammatory bowel disease is a crytorior inflammatory disease such as inflammatory bowel disease is a crytonic inflammatory disease such as inflammatory bowel disease is a crytorior response in a mammal exposed to an antigen or pathogen. An immune response in a mammal exposed to an antigen or pathogen. An confidential or inflammatory response inhibiting composition is useful for suppressing an confidential binds to (I) is useful for detecting the presence of a confidential binds to (I) is useful for detecting the presence of a confidential confidential cytokine receptor in a biological sample.

This sequence encodes a human zcytor17 cytokine receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a cytokine receptor designated zcytor17. CC Zcytor17 has immunomodulatory, antiinflammatory, antiviral, cytostatic, CC antirheumatic, antiarthritic and muscular activities. The zcytor17 CC proteins are useful for treating and diagnosing lymphoid, immune, inflammatory, spleenic, blood or bone disorders. Agonists or anticzycor17 antibodies are useful in stimulating cell-mediated immunity and CC crytor17 antibodies are useful in stimulating cell-mediated immunity and CC infections involving immunosuppression, including certain viral CC infections. They are also useful for inducting cytotoxicity and for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating leukopenias diseases (e.g. rheumatoid arthritis and multiple CC treating autoimmune diseases (e.g. rheumatoid arthritis and multiple CC schomosome 5, specifically to the 5q11 chromosomal region. ABA93767 to ABA93843 and ABB05730 to ABB05745 represent sequences used in the
